Git » **GLOSSARY**

People, Data, & Drugs
Center for Pharmaceutical Data Science Education

In Short

Repo = the whole project
Commit = one saved page
Branch = a separate path
main = the main path
origin = the online copy
HEAD = where you are right now
push/pull = send/get changes

Places

Repository (repo)
The whole Git-tracked project and its history.

Remote repository
A copy of the repo stored somewhere else, usually online (e.g., on GitHub).

origin
The usual name for the main remote repo.

Working directory
The actual files in your folder that you are editing.

Staging area
The waiting area for changes before a commit.

Status & History

Commit
A saved checkpoint.

History
Previous commits.

HEAD
Your current place in Git..

Merge Conflict
Git cannot automatically combine changes.

Untracked file
A file Git sees but is not tracking.

Branches

Branch
A separate line of work.

main
The current *local* default branch.

origin/main
The main branch on the *remote* called origin.

upstream
The remote branch your local branch follows.

Actions

clone
Copy a remote repo to your machine.

initialize (init)
Create a new local Git repo.

add
Put changes into the staging area.

commit
Save staged changes.

push
Send your commits to the remote.

pull
Get remote changes and apply them.

fetch
Get remote changes without applying them.

merge
Combine one branch into another.

switch
Move to another branch.

stash
Temporarily hide uncommitted changes.
